

# FORMECO Water Evaporators

**FORMECO**, leader manufacturer of Solvent Recovery Systems, has solved the problem of the waste water disposal, designing a range of apparatus which guarantee an efficient and economic system for every industry involved in this event.

The technology is based on boiling the waste water ; this water, once distilled, is replaced in the production line whereas the contaminant, now very concentrated, can be disposed off at relatively low cost.

Strong point of this technology is the low running cost of its application. The vacuum distillation, combined with the heat pump technology, allows us to separate the water from the polluted products at a low energy consumption.

**FORMECO** evaporators allow :

- The separation between water and polluted products
- Immediate utilization in production line
- Drastic reduction of waste water to dispose
- Recovery of raw material contained
- Lesser foot print compare to conventional treatment
- Operate 24 hours a day without any human intervention
